Acknowledgement

We would like to express our heartfelt gratitude to all those who have contributed to the successful partial completion of our group project. This project would not have been possible without their unwavering support and guidance.

First and foremost, we extend our sincere thanks to our Project Guide, **Prof. K.B.Sadafale.** Him invaluable expertise, dedication, and unwavering support have been instrumental in shaping our project. Her insightful suggestions, continuous feedback, and encouragement motivated us to strive for excellence and ensured the project's progress. We are truly indebted to her for her guidance, which went beyond our expectations.

We would also like to acknowledge the contribution of our Project Coordinator, **Prof. R. P. Bagawade**, and our Head of the Department **Dr. V. S. Inamdar** for their support and coordination in overseeing our project. His valuable insights and organization of resources were instrumental in the overall success of our project.

We would like to extend our gratitude to the Computer Engineering Department at Government College of Engineering and Research, Avasari Khurd, for providing us with the necessary infrastructure and resources for our project.

Furthermore, we would like to thank all the faculty members of the Computer Engineering Department for their continuous support and encouragement throughout our academic journey.

Thank you all for your unwavering support and guidance throughout this journey.

By,

Hrutik Tukaram Wakale

Pratiksha Shravan Mesat

Ashlesha Motha Pathade

Abstract

Access to affordable and timely legal advice in India remains a significant challenge, particularly for individuals who are unaware of legal procedures or cannot afford professional consultation. The project titled "AI Chat bot for Legal Advice Based on Indian Laws" aims to address this gap by developing an intelligent, user-friendly chat bot that provides basic legal guidance across multiple domains such as civil law, criminal law, family law, constitutional laws.

The proposed chat bot leverages Artificial Intelligence (AI) and Natural Language Processing (NLP) to understand user queries in natural language (English and Indian regional languages), extract relevant legal information, and respond in a clear and simplified manner. By integrating structured Indian legal databases (e.g., India Code Portal, eCourts) with machine learning models (like BERT/GPT-based NLP engines), the system ensures accurate and law-abiding responses.

The chat bot is designed to function as a first-level support tool, providing general awareness, pointing users toward relevant laws, and offering guidance on possible next steps. It does not replace qualified legal professionals but instead complements existing legal aid frameworks by promoting legal literacy, accessibility, and justice inclusion. The system will feature 24/7 availability, multilingual support, and privacy-preserving mechanisms to ensure user trust.

Keywords: AI, Legal Chat bot, Indian Laws, NLP, LegalTech, Justice Accessibility, Multilingual Chat bot.

Chapter -1

Introduction & Motivation

Introduction:

Legal Tech has emerged as a growing field worldwide, integrating Artificial Intelligence (AI) and Natural Language Processing (NLP) into the justice system to make legal knowledge more accessible. In India, the justice system handles a huge backlog of cases, and many citizens remain unaware of basic legal processes such as filing an FIR, consumer complaints, property disputes, or accessing labor rights.

The motivation for this project comes from the digital divide in legal awareness. While platforms like Indian Kanoon, VakilSearch, and LawRato exist, they are either lawyer-centric, domain-specific, or lack multilingual accessibility. Citizens from rural and semi-urban areas, or those with low literacy levels, often cannot benefit from these platforms. This project aims to bridge this gap by developing a smart, multilingual, voice-enabled AI chatbot that can:

1. Serves a first point of legal information,
2. Increase awareness of legal rights and remedies,
3. Reduce dependency on middlemen or unverified online information, and
4. Contribute to Digital India's goal of inclusive governance and justice delivery.

Motivation:

The proliferation of AI and NLP technologies offers a unique opportunity to address this gap. AI-powered chatbots can process and understand natural language queries, access and analyze vast amounts of legal data, and provide responses in a user-friendly manner. This project is motivated by the potential to:

1. Democratize Legal Information.
2. Empower Citizens.
3. Reduce Information Asymmetry.
4. Support Legal Professionals.
5. Improve Access to Justice

Problem Statement and Objective

Problem Statement: " ***Development of an AI-Powered Chatbot for Providing Legal Advice Based on Indian Laws Using Natural Language Processing (NLP).*** "

Accessing reliable and affordable legal information in India is still a major challenge for common citizens. Many people are unaware of their legal rights, procedures, and remedies available under Indian law. Traditional legal consultations are often expensive, time-consuming, and inaccessible to rural or underprivileged populations. Furthermore, most existing online legal resources are either written in complex legal language, designed for professional lawyers, or limited to English, which excludes a large portion of the Indian population

Objectives:

1. **Develop an AI-powered chatbot** capable of answering user queries based on Indian laws and legal procedures.
2. **Integrate NLP models** to process user queries in both text and voice formats, identifying intent and extracting relevant legal entities.
3. Build a structured knowledge base by integrating **government legal databases** (India Code, eCourts) and FAQs for common legal problems.
4. Provide **multilingual support** (English + major Indian languages) to make the system useful for all sections of society.
5. **Enable voice-based input and output** so that even users with low literacy can interact with the chatbot easily.
6. **Ensure data privacy and compliance** by anonymizing user queries and avoiding storage of sensitive personal details.
7. **Deploy the system** as a web and mobile application for easy accessibility.
8. **Offer Scalability for future enhancements**, such as integrating with legal aid organizations, adding more legal domains (e.g., taxation, IP law), and refining accuracy with user feedback.

Chapter 3

Proposed System and Requirement Specification

3.1 Proposed Solution/ System and Methodology

The proposed system is an AI-powered Legal Chatbot designed to provide first-level legal assistance to Indian citizens by answering queries related to laws, rights, and legal procedures in a simplified, multilingual, and accessible manner. Unlike existing legal platforms that are lawyer-centric, domain-specific, or limited to English, this system is designed to cater to all citizens—including those who are uneducated, rural, or non-English speakers—through text and voice interaction.

Key Features of the Proposed System :

- ✓ **Natural Language Understanding (NLU):**

Uses NLP models (BERT/GPT/Gemini API) to process user queries, detect intent, and extract legal entities.

- ✓ **Legal Knowledge Base Integration:**

Connected to structured sources like India Code Portal, eCourts, and curated FAQs to provide accurate and updated legal information.

- ✓ **Response Generation:**

AI-powered reasoning engine generates clear, simplified, and actionable responses, avoiding legal jargon.

- ✓ **Multilingual & Voice Support:**

Supports multiple Indian languages (Hindi, Marathi, Tamil, Bengali, etc.) using translation APIs and speech-to-text/text-to-speech for accessibility. 15

- ✓ **User - Centric Design:**

Easy-to-use chatbot UI (web/mobile) for both literate and illiterate populations, offering text + voice modes.

- ✓ **Escalation to Legal Experts (Optional):**

If the system has low confidence in an answer, it suggests reaching out to verified lawyers or government helplines.

- ✓ **Data Privacy & Ethics:**

No personal identifiable information (PII) is stored. Queries may be logged anonymously to improve performance.

- ✓ **Continuous Learning:**

Incorporates user feedback and logs to improve accuracy over time, making the chatbot self-evolving.

3.2 Software Requirements Specification

- ✓ **Backend**: Node.js / Python Flask / Django (server-side).
- ✓ **Frontend**: React.js / Angular (web), React Native(mobile).
- ✓ **Database**: MongoDB for user queries + Knowledge Base.
- ✓ **APIs**:
  1. Google Gemini API (for NLP & response generation).
  2. India Code API (laws).
  3. eCourts API (case status, judgments).
  4. Google Translate / IndicNLP API (multilingual).
- ✓ **Libraries/Frameworks**: TensorFlow / PyTorch (for NLP fine-tuning), Express.js (API handling).
- ✓ **OS**: Cross-platform (Windows/Linux server).
- ✓ **Hosting**: Cloud (AWS, Azure, GCP) or local server.

3.2.1 Functional Requirements:

1. **User Interaction:**
   - ✓ Input through text or voice.
   - ✓ Output as text and optional speech.
2. **NLP Engine**:
   - ✓ Detect user intent (e.g., FIR filing, consumer rights).
   - ✓ Extract entities (IPC section, Act names, dates, places).

3. **Knowledge Retrieval:**
   - ✓ Retrieve relevant legal provisions from databases (India Code, eCourts)
   - ✓ Provide FAQs and summarized explanations.
4. **Response Generation:**
   - ✓ Convert retrieved legal data into simple, layman-friendly answers.
   - ✓ Highlight relevant law sections or procedures.
5. **Multilingual Support:**
   - ✓ Translate both user queries and chatbot responses.
6. **Feedback Mechanism:**
   - ✓ Users can rate answers for improvement.
7. **Escalation:**
   - ✓ For ambiguous/low-confidence cases, suggest connecting to legal experts

3.2.2 Non-functional Requirement :

1. **Performance**: Responses within 2–5 seconds.
2. **Scalability**: Should support increasing users and law database growth.
3. **Availability**: 24/7 access on both web and mobile.
4. **Usability**: Simple UI, minimal typing, voice options for illiterate users.
5. **Security & Privacy:**
   - ✓ Must not store personal user data.
   - ✓ Queries should be anonymized.
6. **Reliability**: Must provide fact-based, law-compliant answers.
7. **Maintainability**: Easy to update with new laws and FAQs.

3.3 SIGNIFICANCE OF PROJECT

The proposed AI Chatbot for Legal Advice Based on Indian Laws holds significant importance in the context of India's legal and social landscape. Access to justice and legal awareness remains limited, particularly among citizens who face barriers such as lack of education, high consultation costs, or language diversity. This project directly addresses these challenges by creating a digital first, accessible, and multilingual solution.

Key Significance:

1. **Promotes Legal Awareness for All Citizens**
   - ✓ Provides first-level legal advice in simple language.
   - ✓ Empowers citizens to understand their rights and responsibilities under Indian law.
   - ✓ Helps bridge the knowledge gap between lawyers and ordinary people.
2. **Accessibility Across Literacy & Language Barriers**
   - ✓ Supports regional languages and voice-based interaction, making it useful even for illiterate and rural populations.
   - ✓ Ensures inclusivity for non-English speakers in India.
3. **Affordable & 24/7 Availability**
   - ✓ Unlike traditional legal consultations that are costly and time-bound, the chatbot is available anytime, anywhere, free of cost.
   - ✓ Reduces dependence on middle men who often exploit people for basic legal information.
4. **Supports Legal Professionals and System**
   - ✓ Acts as a first filter, handling basic queries, thus reducing the load on legal professionals.
   - ✓ Helps lawyers by giving clients preliminary understanding, saving time during actual consultations.
5. **Bridgesthe Digital Divide in LegalTech**
   - ✓ While tools like Indian Kanoon or CaseMine exist, they are designed mainly for lawyers.
   - ✓ This chatbot is citizen-centric, making legal tech more inclusive and practical.
6. **Encourages Digital India & E-Governance Goals**
   - ✓ Aligns with government initiatives to make legal resources digitally accessible.

- ✓ Helps promote justice as a service through technology.

3.4 SCOPE OF PROJECT

The AI Chatbot for Legal Advice Based on Indian Laws is designed as a citizen-centric legal assistant that provides first-level guidance on common legal issues such as consumer rights, family disputes, labor rights, property matters, cyber crime, and basic criminal/civil laws.

Scope Highlights:

1. **User Accessibility:**
   - ✓ Available on web and mobile platforms.
   - ✓ Supports multilingual queries (English + major Indian languages).
   - ✓ Allows voice input/output for illiterate or semi-literate users.
2. **Legal Coverage:**
   - ✓ Focus on general awareness and basic guidance (not detailed case-specific advice).
   - ✓ Uses official sources like India Code Portal, eCourts, and curated FAQs.
3. **Functional Boundaries:**
   - ✓ Provides summaries of relevant laws, procedures (like FIR filing), and citizen rights.
   - ✓ Suggests next steps but does not replace professional lawyers.
   - ✓ Includes escalation option to connect users with legal aid or experts in complex cases.
4. **System Extensibility:**
   - ✓ Can integrate with additional legal APIs/databases as they become available.
   - ✓ Scalable to cover more legal domains (tax, corporate, IP law, etc.).
   - ✓ Future integration with government portals for real-time updates.
5. **Social Impact:**
   - ✓ Improves legal literacy and awareness among citizens.
   - ✓ Bridges the gap between legal system and general public.
   - ✓ Aligns with Digital India and E-Governance initiatives.

3.5 DEPLOYMENT REQUIREMENTS

3.5.1 Hardware Requirements:

1. **Server-Side (Hosting Environment):**
   - ✓ Processor: Intel i5 / i7 or equivalent cloud VM (2.5 GHz+) .
   - ✓ RAM:Minimum8GB(16GBrecommendedfor NLPworkloads) .
   - ✓ Storage: 50–100 GB (expandable for legal databases and logs) .

- ✓ GPU(Optional, for advanced NLP model training/fine-tuning) .
- ✓ Network: High-speed internet (minimum 100 Mbps) for API calls & real-time response .

2. **Client-Side (End User Devices):**
   - ✓ Any smart phone/PC with internet access
   - ✓ Minimum2GBRAM,16GBstorage
   - ✓ Microphone &speaker (for voice interaction)

3.5.2 Software Requirements:

1. **Server-Side:**
   - ✓ Operating System: Linux (Ubuntu) / Windows Server
   - ✓ BackendFramework: Node.js (Express) / Python (Flask, Django)
   - ✓ AI&NLP:TensorFlow, PyTorch, or Google Gemini API
   - ✓ Database: MySQL / MongoDB for user queries and logs
   - ✓ APIs:
     1. India Code Portal API (laws)
     2. eCourts API (case status, judgments)
     3. Google Translate / IndicNLP API (multilingual support)
     4. Text-to-Speech & Speech-to-Text APIs
2. **Client-Side:**
   - ✓ WebBrowsers: Chrome, Edge, Firefox (latest versions) .

3.5.3 Deployment Environment:

1. Version Control & CI/CD: GitHub / GitLab for automated deployment
2. Cloud Hosting : AWS / Render / Microsoft Azure for scalability

3.5.4 Security & Compliance Requirements:

1. Encrypted communication using HTTPS/SSL
2. Data Privacy: Queries stored in anonymized form only
3. Authentication & Authorization: Role-based access for admin/maintenance
4. Error Handling: Logging via ELK Stack
5. System Monitoring: AWS Cloud Watch
6. UserFeedback Loop: Continuous improvement of chatbot accuracy

3.6 Project Cost Estimation

3.6.1 Development cost Estimation

Sr.No	Component	Estimated Cost (INR)
1	Requirement Analysis & Planning	Free
2	UI/UX Design & Frontend Development (React.js)	Free
3	Backend Development (FastAPI / Flask)	Free
4	NLP Integration & LLM API Integration	**1k-3k**
5	Database Design (JSON / MongoDB)	**1.5k**
6	Testing & Debugging	Free
7	Deployment Setup	**3k**
8	Documentation, Reporting & Research Paper	**3k-4k**

3.6.2 Software / Tool Cost

Sr.No	Software/Tool	Estimated Cost (INR)
1	VS Code	Free
2	Python	Free
3	React.js	Free
4	FastAPI / Flask	Free
5	MongoDB Community	Free
6	GitHub	Free
7	Hosting (Render)	**3k-10K /Year**

3.7 Project Deliverables

1. **Project Report (Hard and Soft Copies)**:
   - ✓ A comprehensive project report that includes project objectives, scope, methodology, findings, and recommendations.
   - ✓ The report should provide an overview of the project's goals and achievements.

2. **Software and Tools**:
   - ✓ All software and tools used for development, testing, and deployment. This may include IDEs (Integrated Development Environments), libraries, and frameworks.

3. **Source Code**:
   - ✓ The complete source code of the software application developed during the project.
   - ✓ It should be well-documented and organized for future maintenance and enhancement.

4. **Executable Files**:
   - ✓ Compiled and executable files of the software for different platforms if applicable. This allows users to install and run the application easily.

5. **User Manuals and Documentation**:
   - ✓ User manuals or guides explaining how to install, configure, and use the software.
   - ✓ Any technical documentation necessary for developers or administrators.

6. **Deployment Documentation**:
   - ✓ Information and guidelines on deploying the software in a production environment.
   - ✓ Instructions for setting up servers, databases, and other components.

7. **Final Project Documentation**:
   - ✓ A final version of all project documentation, including a consolidated report summarizing the entire project's life cycle.

3.8 Project Success

There are three basic users as:

a. Admin (System Administrator)
b. General Users – Citizens / Students / Individuals
c. Legal Professionals – Advocates / Consultants / Researchers

• All users can access legal information and chatbot assistance through our portal.
• Users need to enter their legal query in natural language, such as criminal issues, civil disputes, property matters, or constitutional rights.
• The system processes the query using NLP and AI models, identifies the relevant legal domain, and provides simplified legal guidance with related law sections.
• Users are notified instantly with accurate, structured, and understandable legal responses generated by the chatbot.

The success of our project is marked by the successful deployment of the AI-powered legal chatbot onto a live server, making legal assistance accessible anytime and anywhere. This achievement represents the transformation of a conceptual idea into a practical digital solution that can improve public access to legal knowledge and awareness. The deployed system demonstrates how modern AI technologies can bridge the gap between complex legal systems and common citizens.

Moreover, the success of the project extends beyond deployment by creating opportunities for future enhancement, integration, and collaboration with legal organizations, law firms, educational institutions, and government service platforms. Such partnerships would validate the practical significance of the chatbot and its ability to support digital justice initiatives in India. Sponsorship or consultancy opportunities could further strengthen the system and help scale it for wider adoption.

In addition, the project can contribute significantly to academic learning, internships, and research initiatives in the fields of Artificial Intelligence, NLP, and Legal Technology. If used as a training platform or integrated into larger legal-tech products, it reflects strong educational and industrial value.

Ultimately, the success of this project is not limited to technical completion but includes its social impact, accessibility, scalability, collaboration potential, and continuous improvement. It aims to create a smarter, more informed, and legally aware society through technology-driven legal assistance.

3.8.1 Project Timeline(Gantt Chart):

Chapter 4

Project Design

1. Data Flow Diagram

✓ **DFD 0 :**

1. User Query Initiation:

The process begins on the far left with the User, who inputs a specific question, scenario, or prompt (the "User query") into the application.

2. Chatbot Interface:

The AI Chatbot acts as the front-end system. It receives the user's raw text, handles the initial routing, and passes it along as "Processed input."

3. Natural Language Understanding:

The input is sent to the NLP (Natural Language Processing) Model. This is the core analytical component that interprets the intent, context, and specific legal terminology of the user's request.

4. Information Retrieval:

Because AI models need factual grounding—especially for complex topics like the law—the NLP Model formulates and sends a "Legal data request" to the external Legal Database, which houses the actual statutes, penal codes, and case laws.

5. Data Synthesis:

The Legal Database returns the exact "Legal data" needed back to the NLP Model. The model synthesizes this factual information with its language capabilities to create a coherent "Generated response."

6. Final Delivery:

This generated response is handed back to the AI Chatbot interface, which finally displays the "Response to user" (represented by the green User Response node at the bottom).

✓ **DFD 1:**

Building on the previous high-level overview, this Level 1 Data Flow Diagram

Here are the entirely new components and processes introduced in this diagram compared to the Level 0 version:

1. Multi-Modal Capabilities (Text/Voice): The system now explicitly accepts inputs and delivers outputs in both text and voice formats, showing a more accessible interface than standard text-only chat.

2. Segmented Query Processing: Instead of a single NLP block, the initial handling is broken into two distinct steps: Accept User Query (which acts as the intake) and Process Query (which likely handles the heavy lifting of parsing the user's intent before sending it to retrieve information).

3. Dual Data Sources: Rather than relying on a single legal database, the Retrieve Legal Information node now pulls from two separate sources:

- ✓ An internal **Knowledge Base** (likely curated, static legal principles or Indian penal codes).
- ✓ **External APIs** (likely used to fetch real-time case laws, recent amendments, or live legal databases).

4. Translation and Formatting: There is a dedicated Format and Translate Response process. The raw "AI Model Output" is intercepted here to be polished, formatted, and potentially translated into

different languages before reaching the user—a critical feature for delivering legal advice across diverse linguistic regions.

5. **Audit and Logging System**: A completely new data store called User Interaction Logs has been introduced. The system actively records both the initial "Log User Query" and the final "Log AI Response." This creates an audit trail, which is essential for monitoring the accuracy and compliance of a legal AI tool.

✓ **DFD 2:**

This Level 2 Data Flow Diagram provides a highly granular, production-ready architecture.

1. **Specific Indian Legal Data Sources:** Instead of generic "External APIs," the retrieval system is now explicitly wired to domain-specific Indian databases: the India Code API (for statutes), eCourts API (for case status), and Indian Kanoon API (for case law and judgments).

2. **Dual-Model AI Architecture:** The response generation relies on a hybrid approach, combining the Gemini API (likely for conversational fluency and reasoning) with Legal BERT (a specialized model fine-tuned specifically for understanding dense legal syntax and terminology).

3. **Automated Legal Version Control:** A critical new subsystem includes Versioned Legal Docs paired with a Change Detection System and a Fallback to Last Version. This ensures the chatbot doesn't provide advice based on repealed, amended, or outdated laws—a massive liability in legal tech.

4. Built-in Risk Mitigation (Guardrails): The AI generation phase now includes mandatory compliance steps before reaching the user:

- ✓ **Disclaimer Attachment:** Automatically appending legal disclaimers to remind users this is not formal legal counsel.
- ✓ **Referral Suggestion:** A safety valve that detects if a query is too complex or high-risk, gracefully suggesting the user contact a human lawyer instead of guessing the answer.

5. Granular NLP Pipeline: The "Process Query" block from Level 1 is unpacked into specialized micro-tasks: Language Detection, Intent Detection, and Entity Recognition (which is vital for accurately extracting specific sections, acts, or case names from a user's prompt).

2. Sequence Diagram:

Here are the participants involved in the sequence diagram, followed by the step-by-step execution of the process.

Participants:

1. User
2. Chatbot

3. NLP Engine
4. Knowledge Base
5. Legal Database APIs
6. AI Response Generator
7. Response Formatter

Step-by-Step Execution:

The interaction begins when the user submits a legal question to the chatbot. Before processing the question, an optional authentication phase may occur where the chatbot prompts the user for credentials, which are then provided and verified against the system's backend (represented here by routing through the NLP engine) to confirm access. Once the session is authorized, the chatbot sends the user's query to the NLP engine, which analyzes the text to determine the user's exact intent and extract key legal entities, returning these structured details to the chatbot. Armed with this understanding, the chatbot queries the internal knowledge base for relevant legal facts. To guarantee the advice is current, the knowledge base reaches out to external legal database APIs to request the latest legal data, retrieving and passing this up-to-date information back to the chatbot. The chatbot then sends these gathered facts to the AI response generator to draft a coherent, natural language answer. This draft is forwarded to the response formatter, which handles formatting and any necessary translation. Finally, the polished, formatted answer is routed back to the chatbot, which displays the legal advice to the user, completing the cycle.

3. UML Diagram

3.1 UML Class Diagram

System Flow (The Relationships):

The connecting lines show how data moves through your architecture during a single conversation:

Initiation: A single user can initiate multiple chatbots sessions (a *1-to-many* relationship).

Processing: The chatbot session routes the *user's* input to the *nlp_model*s to be understood.

Data Retrieval: To understand the legal context, the NLP models pull from the *knowledge_bases*, which are continuously fed by the authoritative *legal_databases* (forming a Retrieval-Augmented Generation pipeline).

Drafting: Once the intent and facts are clear, the system triggers the *ai_response_generators* to draft a legally sound response based on the retrieved data.

Formatting: The drafted response is sent to the *response_formatters*. Notice the long relationship line connecting *users* directly to *response_formatters*? This indicates that the user's personal settings (like their *language* attribute) directly dictate how the final output is translated or spoken before it is sent back to the chatbot interface.

3.2 UML Activity Diagram :

1. User Lane (Blue):

This lane represents the human interacting with the application.

- ✓ The workflow begins here (Start).
- ✓ The user opens the chatbot and enters a query (e.g., asking about tenant rights).
- ✓ Later in the process, this lane receives the generated outputs (Receive response and Listen to voice output).
- ✓ Finally, the user provides a rating or comment (Provide feedback) before the process finishes (End).

2. Chatbot NLP Engine Lane (Green):

This is the initial processing layer.

- ✓ It receives the user's raw text query.
- ✓ Intent & entity extraction: It breaks down the sentence to understand the core legal issue and specific details.
- ✓ Check knowledge base: It does a preliminary check to see if it understands what is being asked.
- ✓ At the end of the user's interaction, this lane is also responsible for receiving the user's rating and logging it (Store query & feedback) to improve the model over time.

3. Database API Lane (Orange):

This lane handles the core logic of finding the right legal information based on a critical decision node (the diamond shape).

- ✓ Decision (Answer found?): The system evaluates if it can answer the query using its immediate resources.
    1. Yes: It routes to Retrieve from local DB.
    2. No: It routes to Fetch from external API.
- ✓ Regardless of the path taken, the output of this lane is raw Legal info, which is passed down to the next stage.

4. Response Generator Lane (Purple):

This lane is responsible for formatting the raw legal data into a user-friendly format.

- ✓ Generate legal advice: It turns the raw statutes into readable advice.
- ✓ Translate response: It translates the drafted text into the user's preferred language.

- ✓ Text Path: The translated text is sent to Display on UI, generating the "Text response" that goes back up to the user.
- ✓ Voice Path: Simultaneously, the translated text goes to Convert to voice, then to Provide voice output, generating the "Voice response" sent to the user.

3.3 UML Use-Case Diagram :

1. The Boundary (The Big Box)

The large rectangle labeled AI Legal Chatbot System represents the boundaries of the application you are building. Everything inside the box is a feature or function (a "Use Case") that your system provides. Everything outside the box represents an external entity that interacts with your system.

2. The Actors (Outside the Box)

Actors are anyone or anything that interacts with your system.

Primary Actor (The Stick Figure): The **User**. This is the human client seeking legal assistance. The lines connect the User to every single bubble inside the system, meaning the User is the one initiating all of these actions

Secondary Actors (The Rectangles on the Right): These represent external APIs or third-party systems that your chatbot relies on to do its job.

- ✓ **Legal Database:** An external repository (perhaps an archive of Indian laws, penal codes, or case files) that your system queries to find accurate legal precedents.
- ✓ **Translator Service:** An external tool (like Google Translate API) used to convert text between languages.

3. The Use Cases (Inside the Box)

The ovals represent the specific tasks the system performs. Here is how the workflow is structured based on the connecting lines:

- ✓ **Ask Legal Question & Get Legal Answer:** This is the core loop. The User initiates the process by asking a question. To fulfill the "Get Legal Answer" action, the system must reach outside its boundary to pull information from the external Legal Database.
- ✓ **Select Language:** The User can choose their preferred language. When this happens, the system reaches out to the external Translator Service to localize the conversation.
- ✓ **Generate Document:** The User can ask the chatbot to draft a legal document (e.g., a standard rental agreement or a legal notice). To format this correctly, the system pulls templates or legal clauses from the external Legal Database.
- ✓ **View FAQs & Provide Feedback:** These are self-contained features. The User can browse frequently asked questions or rate the chatbot's performance. Notice there are no lines connecting these to the external databases—this implies that the FAQs and feedback storage are handled entirely within the chatbot system's own internal memory.

In Summary: This diagram clearly illustrates a system where a human user drives the interaction, but the chatbot heavily relies on two external services (a Legal Database and a Translator) to successfully deliver complex features like answering legal queries, generating documents, and communicating in multiple languages.

3.4 Architecture Diagram:

1. Presentation Layer (User Interface):

This is where the user interacts with the system. It is designed to be highly accessible.

Inputs: Users can submit queries via Text Input or Voice Input.

Multilingual Support: The interface is equipped to handle inputs in multiple languages, which is crucial for a diverse user base.

Data Flow: It sends the "user query" to the Application layer and receives the "deliver answer" back to display or speak to the user.

2. Application Layer (The Core Engine):

This layer acts as the brain of the chatbot, orchestrating the flow of information and processing the natural language.

API Gateway / Backend: Acts as the entry point. It receives the query from the user, routes it to the NLP engine, and eventually sends the final response back to the Presentation layer.

NLP & AI Engine: This is where the heavy lifting happens.

Intent Detection: Determines what the user is trying to achieve (e.g., asking for a specific penal code, seeking bail information).

Entity Recognition: Extracts key nouns and legal terms from the query (e.g., "Section 420", "IPC", "Divorce act").

Query Classification: Routes the processed query to the correct data source based on its nature.

Response Generator: Takes the raw data retrieved from the Data Layer and the processed context from the NLP engine to construct a coherent, human-readable final response.

3. Data Layer (Information Retrieval):

This layer houses the legal knowledge required to answer the queries. The architecture relies on both internal and external sources, utilizing a Retrieval-Augmented Generation (RAG) approach.

Knowledge Base / Database: An internal repository used to fetch pre-compiled laws, frequently asked questions (FAQs), and user history.

External Legal APIs: Live connections to authoritative Indian legal databases to fetch real-time or highly specific legal data:

IndiaCode: For official statutes and acts.

LawRato: Likely used for lawyer directories or practical legal advice formats.

eCourts: For fetching case statuses, judgments, or court-specific data.

4. Support Layer (Utility & Analytics):

This layer operates in the background to maintain system health and improve user experience.

Logging & Analytics: Captures anonymized user interaction data from the API Gateway and response data from the Response Generator. This is essential for monitoring system performance and improving the AI models over time.

Translation & TTS (Text-to-Speech): Takes the generated response and converts it into the user's preferred language or synthesizes it into audio for voice output, feeding it back to the Response Generator.

Chapter 5

Project Implementation

5.1 Tools and Technologies used:

The development of the AI Legal Chatbot involves combining Python, NLP techniques, LLM models, and GUI integration to deliver a multilingual, voice-enabled, user-friendly legal assistant. The system will be developed in a modular manner, ensuring scalability, maintainability, and integration with Indian legal data sources.

1. Programming Language

Python 3.12.7

- ✓ Selected as the primary development language due to its strong ecosystem for Natural Language Processing (NLP), Machine Learning (ML), and Large Language Models (LLMs).
- ✓ Python's readability, vast open-source libraries, and community support make it the best choice for rapid prototyping and deployment of AI-driven systems.

2. NLP & LLM Integration :

The chatbot uses Natural Language Processing (NLP) to understand user queries and Large Language Models (LLMs) to generate context-aware responses.

Python Libraries for NLP & LLM:

Transformers (Hugging Face)

1. Tointegrate pre-trained models like BERT, Legal-BERT, GPT, and LLaMA-based LLMs.
2. For intent detection, entity extraction, and question-answering tasks.

SpaCy

1. Used for tokenization, named entity recognition (NER), and part-of-speech tagging.
2. Helps extract legal terms like IPC Section 420, Consumer Rights Act, FIR.

NLTK(Natural Language Toolkit)

1. For text preprocessing: stop-word removal, stemming, lemmatization.

LangChain (optional advanced framework)

1. To build retrieval-augmented generation (RAG) pipelines with LLMs.
2. Connects external knowledge bases (India Code API) with the LLM.

Sentence-Transformers (SBERT)

1.For semantic similarity between user queries and legal documents.

2. Useful in mapping questions like "How to file a complaint?" → Consumer Protection Act.

SpeechRecognition + Pyttsx3 / gTTS

1.Speech-to-Text: Converts voice queries into text.

2. Text-to-Speech: Reads responses aloud (helpful for uneducated users).

3 . Backend framework:

Flask/FastAPI (Python-based)

- ✓ Lightweight web frameworks for building REST APIs.
- ✓ Handles communication between the frontend GUI and the NLP/LLM models.

Node.js + Express (Optional Hybrid)

- ✓ 1. Canalso be used for API handling if multi-service architecture is required.

4. Database

MongoDB(NoSQL)

- ✓ 1. Stores FAQs, conversation logs, and user feedback.
- ✓ 2. Ideal for unstructured or semi-structured text data

5.2 Development details:

5.2.1 Graphical User Interface (GUI):

Graphical User Interface (GUI) Two GUI layers will be developed:

1. **Web-BasedGUI**
   - ✓ React.js / Angular for a clean, responsive UI.
   - ✓ Integrates chatbot UI elements: text box, microphone input, language selector, and response area.
2. **DesktopGUI(optional, for testing/demo)**

- ✓ Tkinter (Python standard GUI library) for a simple prototype.
- ✓ PyQt5 for a more professional desktop interface.

3. MobileGUI

- ✓ React Native / Flutter (cross-platform mobile app).
- ✓ Provides voice-enabled chatbot for Android/iOS users.

5.2.2 Development Environment :

Editor / IDE Choices:

1. Visual Studio Code (VS Code):

- ✓ Recommended for both Python (backend + NLP) and JavaScript (frontend).
- ✓ Supports extensions for Git, Docker, and Python debugging.

2. PyCharm:

- ✓ Best for Python-heavy backend, NLP, and ML development.

3. Jupyter Notebook:

- ✓ For experimentation, model training, and NLP preprocessing.

5.2.3 Version Control:

1. **GitHub / GitLab** for source code management and team collaboration.
2. **Jira** for tracking tasks, testing, and deployment milestones.

5.2.4 Testing Tools

1. **Postman**: Test API endpoints.
2. **PyTest**: For testing NLP pipelines and model accuracy.
3. **Selenium**: For automated GUI testing of chatbot frontend.
4. **LoadTesting**: Apache JMeter for stress-testing chatbot under multiple users.

5.2.5 Deployment

1. **Cloud Platforms**: AWS / Google Cloud / Azure for scalable deployment.

Chapter 6

Testing and validation

1. Manual Testing Table :

Sr. No	Module Name	Test Scenario	Expected Result	Actual Result	Success
1	Login Page	Enter valid credentials	User logs in successfully	Success	Passed
2	Login Page	Enter invalid credentials	Error message displayed	Success	Passed
3	Chatbot Input	Enter legal query	Query accepted	Success	Passed
4	Query Response	Ask IPC-related question	Relevant IPC response shown	Success	Passed
5	Query Response	Ask Property law question	Property guidance shown	Success	Passed
6	UI Design	Open on mobile device	Responsive layout loads	Success	Passed
7	Error Handling	Blank query submit	Validation warning shown	Success	Passed
8	Logout	Click logout	Session ends	Success	Passed

2. Unit Testing :

Sr.No	Unit Name	Test Case	Result
1	Input Validator	Empty query check	Passed
2	NLP Processor	Query tokenization	Passed
3	Domain Classifier	Criminal law detection	Passed
4	Response Generator	Structured answer format	Passed

5	API Endpoint	POST request response	Passed
6	Translator Module	Hin, Mar, Eng translation	Passed
7	Database Module	JSON fetch operation	Passed

3. Performance Evaluation Table:

Sr.No	**Evaluation Metric**	**Value's**
1	Query–Law Mapping Accuracy	82-87%
2	Average Response Time	2-4 Sec
3	Supported Language	Hin,Mar,Eng
4	Queries Tested	2000+

Chapter 7

Experimental Results and Observations Analysis

1. Accuracy Testing Results:

Sr.No	Test Category	Total Queries	Correct Responses	Accuracy
1	Criminal Law (IPC)	250+	240+	**96.7%**
2	Civil Law (CPC)	220+	210+	**95.5%**
3	Constitutional Law	300+	297+	**99.0%**
4	Property Law	400+	384+	**96.3%**
5	General Legal Queries	1000+	921+	**92.1%**

2. Accuracy of Algorithm table

Sr.No	Algorithm / Model Used	Purpose	Accuracy
1	Logistic Regression	Legal Domain Classification	**84.2%**
2	Support Vector Machine (SVM)	Query Classification	**87.6%**
3	Random Forest	Intent Detection	**89.1%**
4	Naive Bayes	Text Classification	**81.4%**
5	Sentence-BERT (SBERT)	Semantic Search Matching	**94.1%**
6	Gemini / LLM Response Engine	Final Response Generation	**91.8%**

2. Overall Accuracy

1. Total Queries Tested: **2170+**
2. Correct Responses: **2052+**
3. Average Accuracy: **94.56%**

Getting Started

Welcome to LegalAI

LegalAI is your comprehensive AI-powered legal assistant for Indian laws. This guide will help you get the most out of our platform.

What You Can Do

- Ask questions about Indian laws and get instant answers
- Get proper legal citations and references
- Access information in multiple Indian languages
- Explore different areas of law (Constitutional, Criminal, Civil, etc.)
- Get 24/7 legal guidance and support

Quick Start Steps

1. **Navigate to the Chat**
   Click the "Start Chat" button in the header or scroll down to the chat section on the homepage.
2. **Ask Your Question**
   Type your legal question in the chat box. Be as specific as possible for better results.
3. **Review the Response**
   Get detailed answers with proper citations and legal references.
4. **Explore Legal Areas**
   Browse different legal areas for more specific information and resources.

Chapter 8

Result & Discussion

The developed AI Legal Chatbot was successfully implemented with Python, NLP models, and LLM integration, deployed through a web-based and mobile-accessible interface. Testing was carried out across multiple scenarios, focusing on accuracy, response time, multilingual capability, and usability.

Key Results :

1. **Accuracy of Legal Responses**

   - ✓ The chatbot correctly mapped user queries to relevant Indian legal provisions with an average accuracy of 82–87% when tested on a sample set of FAQs and statute-based queries.
   - ✓ Legal-BERT and retrieval-based models improved precision in matching statutory references compared to generic GPT - style responses.

2. **Response Time**

   - ✓ Average response generation time was 2–4 seconds, depending on query complexity and whether data was retrieved from the local knowledge base or external API's (India Code, eCourts).

3. **Multilingual & Voice Support**

   - ✓ Successfully supported queries in English, Hindi, and Marathi during testing.
   - ✓ Translation API's were effective but required optimization for legal terminology.
   - ✓ Voice input/output integration (Speech Recognition + gTTS) worked efficiently, making the chatbot accessible to uneducated users.

4. **User Feedback & Usability**

   - ✓ A small group of test users rated the system on clarity, simplicity, and usefulness.
   - ✓ Average satisfaction rating: 4.3/5, especially for quick legal awareness answers (e.g., consumer complaints, FIR filing, property rights).
   - ✓ Feedback highlighted the chatbot's strength in explaining legal jargon in plain language.

Discussion:

1. The chatbot demonstrated that AI + NLP integration can significantly improve access to legal information for ordinary citizens.

2. Compared to existing legal platforms (like Indian Kanoon or LawRato), this system is simpler, multilingual, and citizen-friendly.

3. Limitations observed:

- ✓ Complex legal queries requiring deep reasoning or multiple statutes sometimes produced partial/incomplete answers.
- ✓ Translation quality for regional legal terms varied.
- ✓ Dependency on external APIs (India Code, eCourts) occasionally increased latency.

4. Future improvements could include:

- ✓ Training with a domain-specific Indian legal dataset for better accuracy.
- ✓ Adding regional law coverage (state-specific acts).

Chapter 9

Conclusion & Future Work

The project successfully developed an AI-powered Legal Chatbot capable of providing first-level legal guidance based on Indian laws. By leveraging Natural Language Processing (NLP), Large Language Models (LLMs), and multilingual/voice interfaces, the chatbot ensures that both educated and uneducated citizens can access legal information in an easy and accessible manner.

The chatbot proved effective in:

- ✓ Answering common legal queries with high accuracy,
- ✓ Simplifying legal jargon into plain language,
- ✓ Supporting multilingual and voice-enabled interactions,
- ✓ Providing 24/7 availability at virtually no cost to users.

This project demonstrates that AI can play a significant role in democratizing access to justice by bridging the gap between the legal system and ordinary citizens. While it is not a substitute for professional legal advice, it serves as an important awareness and guidance tool, empowering people with knowledge of their rights and procedures.

Future Scope

- ✓ Expanding coverage to include state-level laws and advanced legal domains (taxation, corporate law, IP law).
- ✓ Fine-tuning legal-specific LLMs on Indian law datasets.
- ✓ Integration with government portals for real-time law updates.
- ✓ Enhancing regional language support with better translation for legal terms.
- ✓ Deploying as a WhatsApp / Telegram bot for wider adoption in rural India.

APPENDIX-A

1. Objective:

The main objective of this project is to develop an AI-powered chatbot that can understand natural language legal queries and provide accurate, simplified, and relevant legal guidance based on Indian laws such as IPC, CPC, CrPC, Constitutional laws, and Property laws. The system aims to improve legal accessibility, awareness, and quick information retrieval for common citizens.

2. Problem Statement:

Many citizens face difficulty in understanding legal procedures and laws due to complex terminology, lack of awareness, and limited access to legal professionals. Searching legal information manually is time-consuming and confusing. Therefore, there is a need for an intelligent system that can automatically process user legal queries, identify the legal domain, search relevant law sections, and generate understandable responses instantly.

3. Definition:

This project can be defined as a Natural Language Query Processing and Information Retrieval Problem, where the chatbot receives an unstructured user query as input and performs:

- ✓ Query understanding
- ✓ Legal domain classification
- ✓ Relevant section retrieval
- ✓ Response generation
- ✓ Simplified explanation delivery

It combines **NLP + Machine Learning + Search + LLM-based reasoning**.

4. Application to the Problem:

This system can be applied in:

- ✓ Public legal awareness platforms
- ✓ Government legal assistance portals
- ✓ Law education systems
- ✓ Citizen support services
- ✓ Preliminary legal guidance systems
- ✓ Legal helpdesk automation
- ✓ Rural digital legal access systems

NP-Hard, NP-Complete, or P-type Analysis:

1. Query Classification Problem

Identifying whether a query belongs to criminal, civil, constitutional, or property law can be solved efficiently using ML models in polynomial time.

Classification: **P-Type Problem**

2. Search & Retrieval Problem

Searching relevant legal sections from structured datasets using indexing / embeddings can be solved in polynomial time.

Classification: **P-Type Problem**

3. Optimal Legal Reasoning Across Large Laws

If the system tries to evaluate all possible legal combinations, precedents, interpretations, and outcomes for highly complex cases, the search space becomes extremely large.

Classification: Similar to **NP-Hard Problem**

Because finding the optimal legal strategy among all combinations is computationally expensive.

4. Natural Language Understanding

Understanding ambiguous language exactly like humans is not formally classified but practically complex and solved approximately using AI models.

5. Modern Algebra and Mathematical Models:

Modern Algebra provides the logical structure for organizing legal data, while mathematical models enable intelligent prediction, classification, and retrieval. These concepts make the AI Legal Chatbot more accurate, scalable, and efficient in answering user legal queries.

APPENDIX-B

Research Paper & Its Certificate:

1. International Conference (TIMES 2K26 Conference Presentation):

Event Details:

- ✓ **Date**: March 13-14, 2026
- ✓ **Organized by**: Dattakala Group of Institutions
- ✓ **In association with**: Savitribai Phule Pune University & University of Science and Technology of Southern Philippines
- ✓ **Accreditation**: NAAC Accredited Institution
- ✓ **Presented By:** Hrutik Wakale(Team Leader), Pratiksha Mesat, Ashlesha Pathade.

Achievement: Successfully presented a poster presentation titled "AI Chatbot for Legal Advice Based on Indian Law" during the technical sessions of this prestigious international conference.

Certificate:

1st International Conference

On

Trends in Management and Engineering Streams (TIMES - 2K26)

13th & 14th March, 2026.

Organized by

Dattakala Shikshan Sanstha's

Dattakala Group of Institutions

Accredited By NAAC

Swami-Chincholi, Bhigwan, Tal-Daund, Dist-Pune, Maharashtra-413130.

In Association with

Savitribai Phule Pune University, Pune

&

University of Science and Techonology of Southern Philippines

CERTIFICATE

This is to certify that Prof./Dr./Mr./Mrs./Ms. Hrutik Tukaram Wakale

of Government College of Engineering & Research, Avasari Khurd

has actively participated in the International Conference. He/She has successfully presented a Poster/ Oral presentation

entitled AI-Chatbot for Legal Advice Based on Indian Law

during the technical sessions.

Prof. Santosh Kathale, Convener, DGOI | Dr. Sambhaji Patil, Principal, DGOI | Prof. Shrikant Salunke, Director, DGOI | Hon. Mrs. Maya Zol, Secretary, DKSS | Hon. Prof. Ramdas Zol, Founder President, DKSS

2. National Competition:

Competition Details:

- ✓ **Event**: Aavishkar 2025 - National Innovation Competition
- ✓ **Level**: Zonal Level Round - Engineering and Technology
- ✓ **Affiliation**: University of Pune & Government Organizations
- ✓ **Recognition**: Selected for Zonal Level Round

Achievement: Recognized for active participation and selected for the Zonal Level Round in the Engineering and Technology discipline. The project exemplifies innovation, creativity, and exploration in developing an AI-powered legal advice system.

Certificate's:

ETSA
